

CSIT128 / CSIT828

HTML

Joseph Tonien

HTML

is a markup language for describing web documents

used to mark parts of documents to indicate
how they should appear on a display

HTML stands for **H**yper **T**ext **M**arkup **L**anguage

HTML documents are described by **HTML tags**

Each HTML tag describes different document content

The first HTML document

```
<html>
```

```
<head>
```

```
<title>JT</title>
```

```
</head>
```

```
<body>
```

```
Hello World!
```

```
</body>
```

```
</html>
```

The first HTML document

```
<html>
```

```
<head>
```

```
<title>JT</title>
```

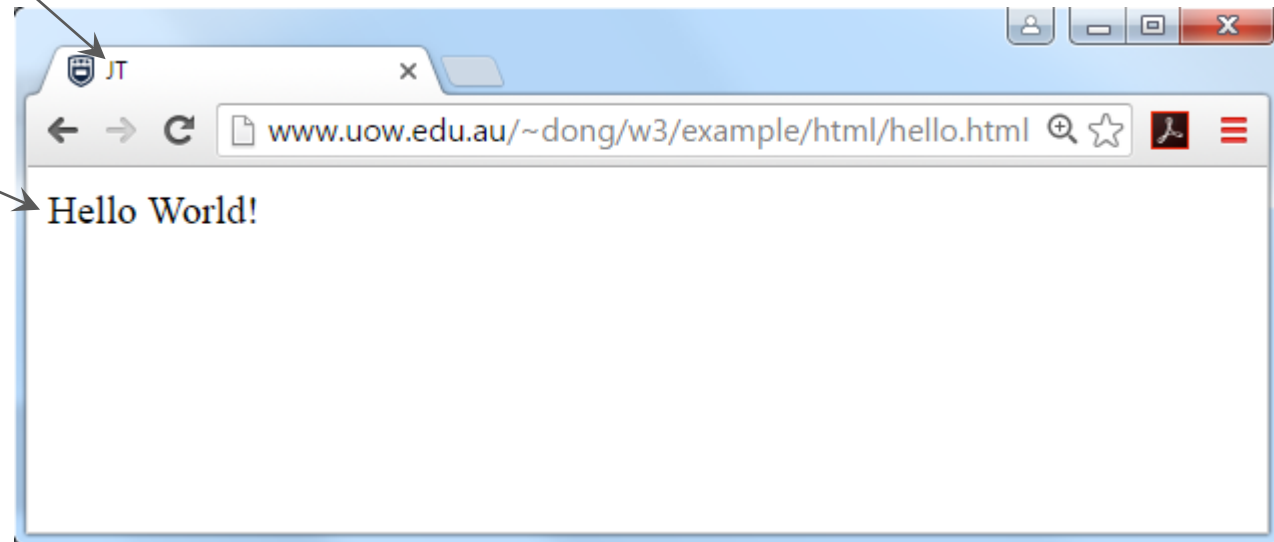

```
</head>
```

```
<body>
```

```
Hello World!
```

```
</body>
```

```
</html>
```

HTML document structure

```
<html>
```

```
<head>
```

```
<title>JT</title>
```

```
</head>
```

```
<body>
```

```
Hello World!
```

```
</body>
```

```
</html>
```

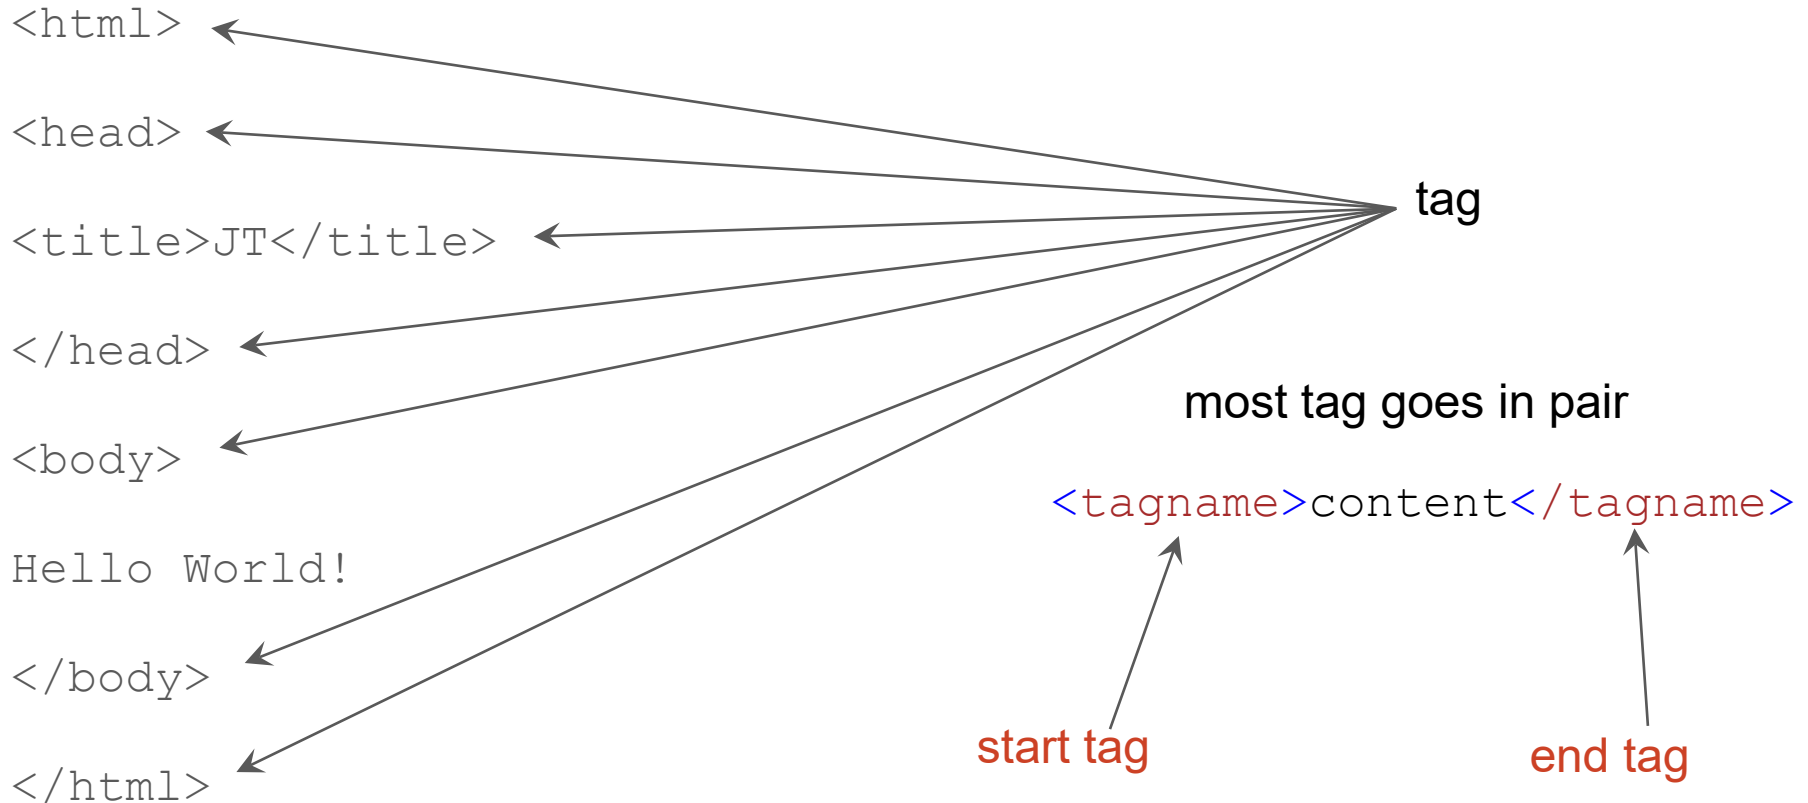

- A HTML document starts with **<html>** and ends with **</html>**
- A HTML document has a **head** and a **body**
- The visible part of the HTML document is between **<body>** and **</body>**

HTML tags

HTML tags

tags are **NOT** case sensitive

HTML **documents** are made up by HTML **elements**.
The HTML **element** is everything *from the start tag to the end tag*.

Heading tags

```
<body>
```

```
<h1>Heading 1</h1>
```

```
<h2>Heading 2</h2>
```

```
<h3>Heading 3</h3>
```

```
<h6>Heading 6</h6>
```

```
Normal text...
```

```
</body>
```

Heading tags: **<h1>**, **<h2>**, ..., **<h6>**

<h1> the most important heading

<h6> the least important heading

Paragraph tag <p>

```
<body>
```

```
<p>This  is a paragraph</p>
```

```
<p>Another
```

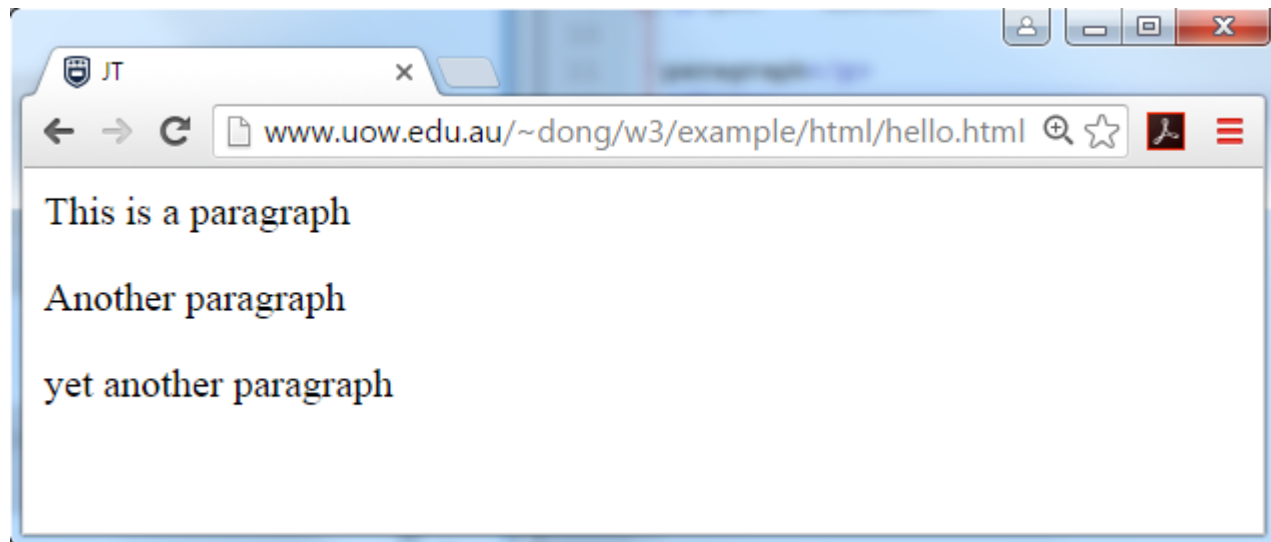

```
paragraph</p>
```

```
<p>yet      another
```

```
paragraph</p>
```

```
</body>
```

Extra spaces and lines will NOT
be displayed in paragraph

Line break

```
<body>
```

```
<p>This   is a paragraph</p>
```

```
<p>Another <br />
```

```
paragraph</p>
```

```
<p>yet      another <br />
```

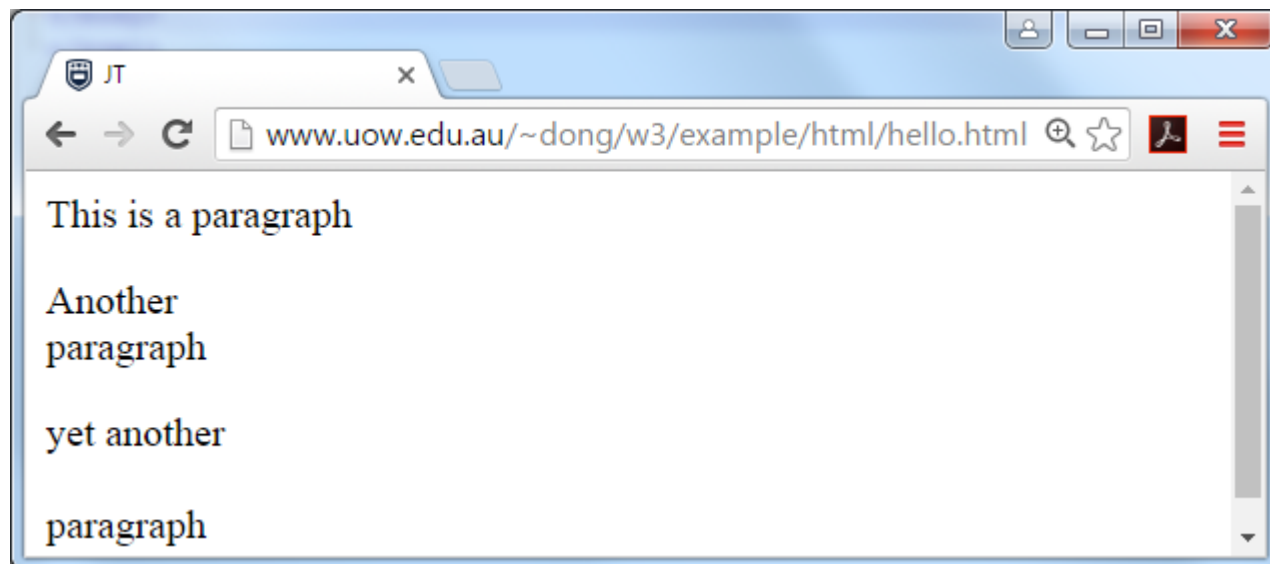

```
<br />
```

```
paragraph</p>
```

```
</body>
```

**
** tag defines a **line break**

**
** is an **empty element**
(i.e. it is a tag with no content),
it combines the start and end
tags together

Horizontal line <hr />

```
<body>
```

```
<p>This is a paragraph</p>
```

```
<p>Another <br />
```

```
paragraph</p>
```

```
<hr />
```

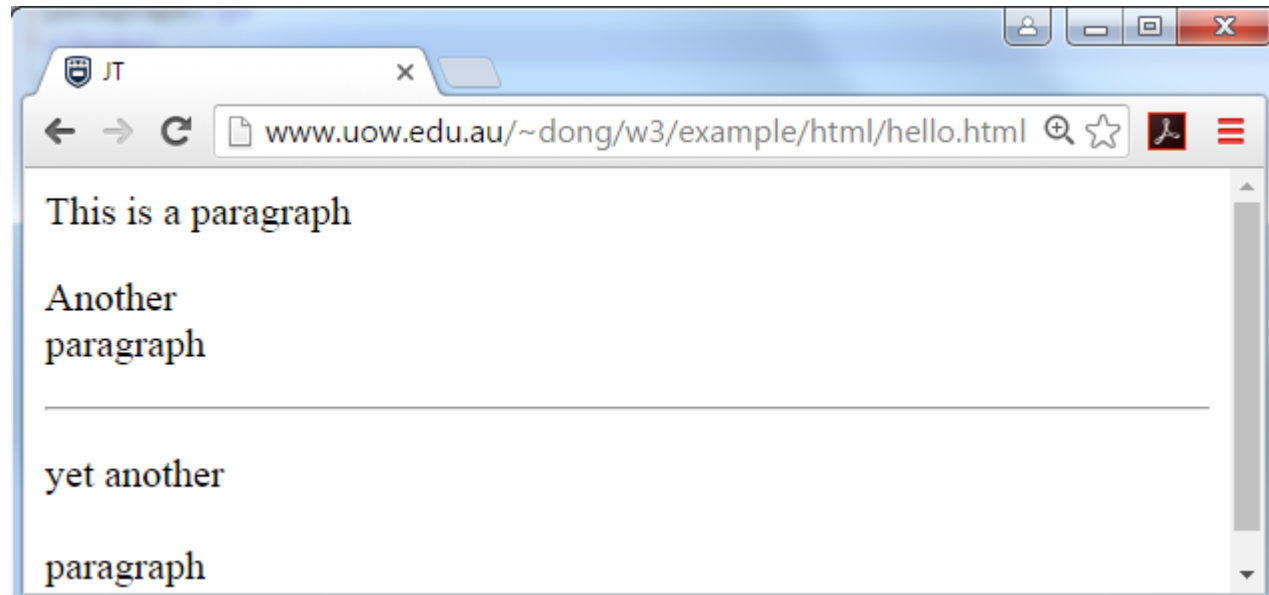

```
<p>yet another <br />
```

```
<br />
```

```
paragraph</p>
```

```
</body>
```

similarly, we have the
horizontal line tag **<hr />**
with no content

Non-breaking space

```
<body>
```

```
<p>This &nbsp; &nbsp; is a  
paragraph</p>
```

**use ** for non-breaking space

```
<p>Another <br />
```

this is an example of **character entities**

```
paragraph</p>
```

```
<hr />
```

```
<p>yet      another <br />
```

```
<br />
```

```
paragraph</p>
```

```
</body>
```

Character entity

- Some characters are reserved in HTML.
- Reserved characters in HTML must be replaced with character entities.

Character	Entity	Meaning
(non-breaking space)	<code>&nbsp;</code>	Non-breaking space
<code><</code>	<code>&lt;</code>	Is less than
<code>></code>	<code>&gt;</code>	Is greater than
<code>&</code>	<code>&amp;</code>	Ampersand
<code>"</code>	<code>&quot;</code>	Double quote
<code>'</code>	<code>&apos;</code>	Single quote (apostrophe)
<code>°</code>	<code>&deg;</code>	Degree
<code>©</code>	<code>&copy;</code>	Copyright

Character entity

`<body>`

A HTML document starts with
`<html>` and ends with
`</html>`

`</body>`

`<body>`

A HTML document starts with
`<html>` and ends with `</html>`
`</body>`

A HTML document starts with `<html>`
and ends with `</html>`

Block quotations <blockquote>

```
<body>
```

```
<p>normal paragraph</p>
```

```
<blockquote>
```

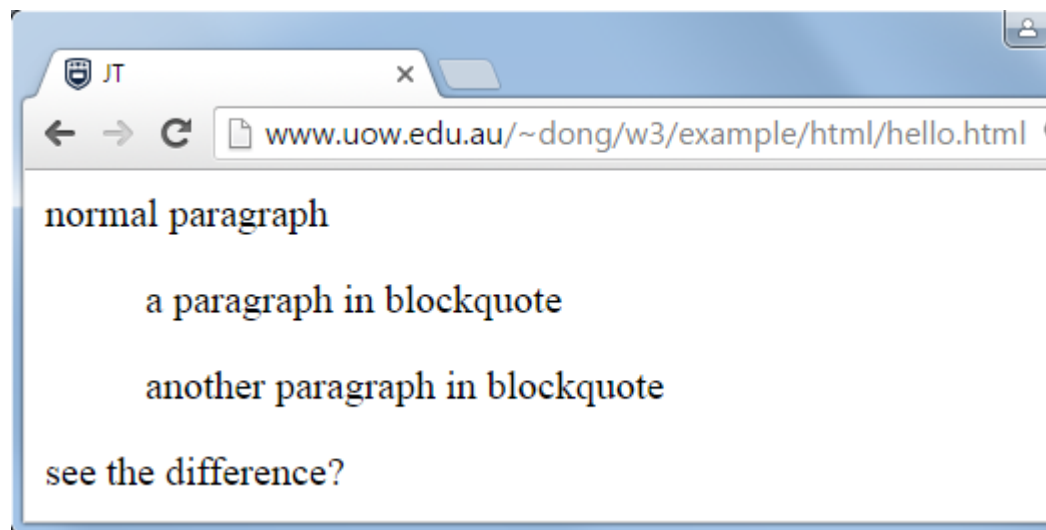

```
<p>a paragraph in blockquote</p>
```

```
<p>another paragraph in blockquote</p>
```

```
</blockquote>
```

```
see the difference?
```

```
</body>
```

Formatting text

```
<body>
```

```
<i>italic text</i> <br />
```

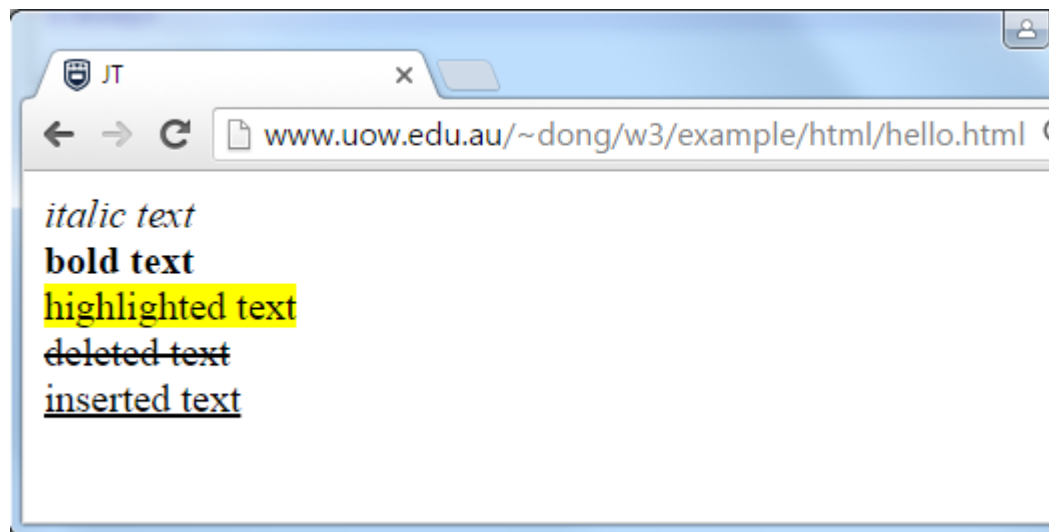

```
<b>bold text</b> <br />
```

```
<mark>highlighted text</mark> <br />
```

```
<del>deleted text</del> <br />
```

```
<ins>inserted text</ins> <br />
```

```
</body>
```

Formatting text

```
<body>
```

```
<h1>HTML <small>Small</small> Formatting</h1>
```

```
HTML <small>Small</small> Formatting
```

```
</body>
```

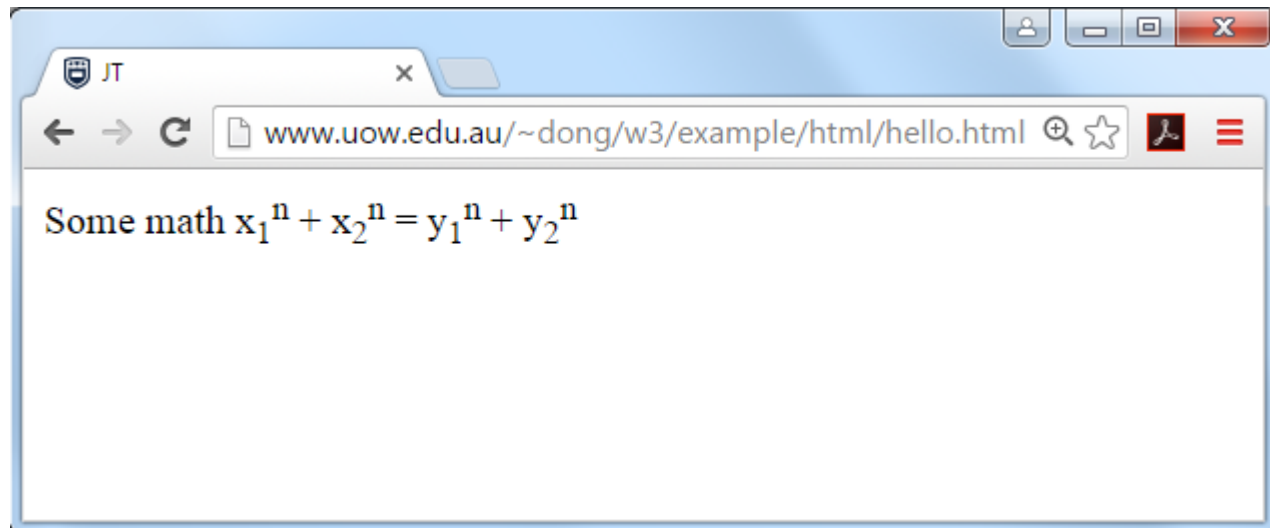

Formatting text

<body>

Some math

$x_1^n + x_2^n = y_1^n + y_2^n$

</body>

Preformatted text <pre>

<body>

<pre>

Mary

had a

little

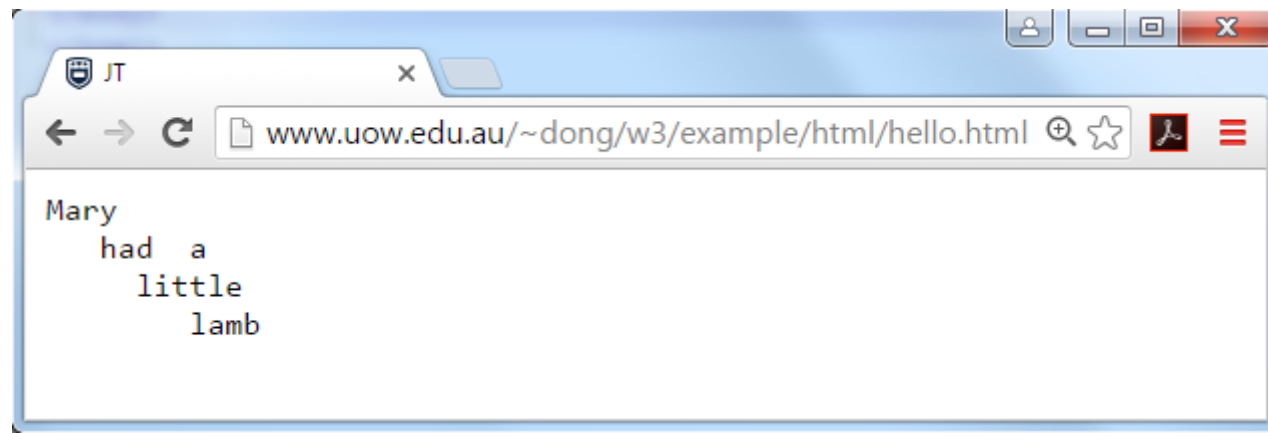

lamb

</pre>

</body>

pre element is shown in monospace

it preserves the character and line spacing

Computer code

<body>

<pre>

<code>

a = 0;

b = 3;

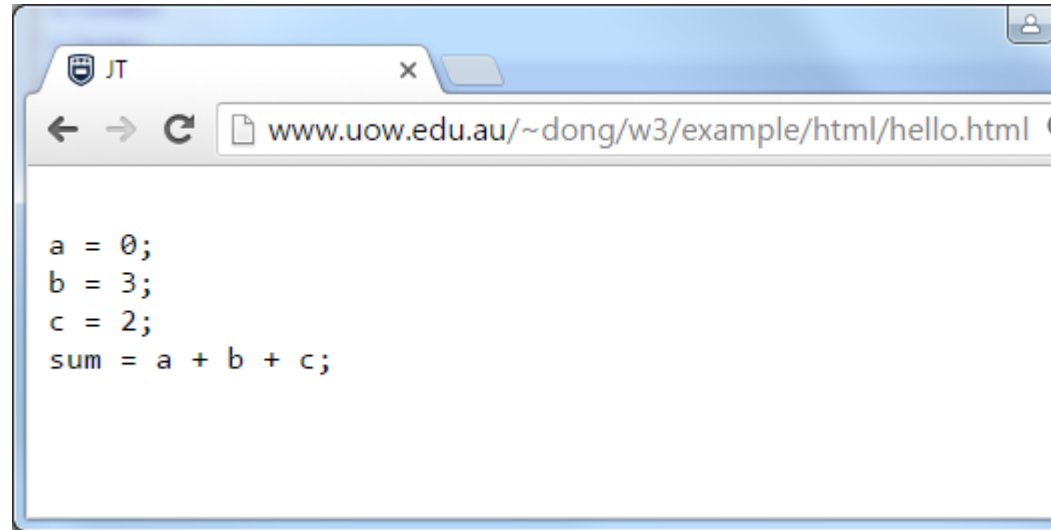

c = 2;

sum = a + b + c;

</code>

</pre>

</body>

*what would happen if we use <code> ... </code>
without <pre> ?*

Computer code

<body>

<pre>

<code>

```
#include <iostream>
```

```
void main( ) {
```

```
    cout << << "Hello World!" << endl;
```

```
}
```

</code>

</pre>

</body>

If you want to include special characters such as

< > & " '

*within **pre** tags, they should be substituted by character entities so that they are not subject to special interpretation by the browser.*

```
#include <iostream>
```

```
void main( ) {
```

```
    cout << "Hello World!" << endl;
```

```
}
```

Image

```
<body>
```

```

```

```
</body>
```

Attribute	Description
src	URL of an image, for example src="uow-logo.png" src=" images /uow-logo.png" src=" http:// www.mycom.au/staff.png"
alt	alternate text for an image
height width	optional. Specifies height, width for image in pixels, or in percentage

Image alt

```
<body>
```

```

```

```
</body>
```

- If a browser cannot find an image, it will display the `alt` text.
- Sometimes, to save bandwidth, user can disable image display, in this case, the `alt` text will be display.
- A screen reader is a software program that can read what is displayed on a screen which is very useful to people who are blind or visually impaired. Screen readers can read the `alt` text.

Image src

The URL of an image can be

- an **absolute** URL points to another website
- or a **relative** URL points to an image file within a website

Absolute URL

```
src="http://www.mycom.au/staff.png"
```

Relative URL

`src="uow-logo.png"` : the image file is in the **same directory** as the current html file

`src="images/uow-logo.png"` : the image file is in the subdirectory called **images** located at the same directory as the current html file

`src="images/logo/uow-logo.png"`

`src="../../../f1/bird.png"` 

Tag attributes

```
<body>
```

```

```

```
</body>
```

HTML elements can have **attributes**

Attributes provide **additional information** about an element

Attributes are always specified in **the start tag**

Attributes come in name/value pairs like: **name="value"**

Example: img has the following attributes: src, height, width, alt

Link

```
<body>
```

```
<a href="http://www.uow.edu.au" target="_blank">Visit UOW</a>
```

```
<a href="contact.html">Contact us</a>
```

```
<a href="http://www.uow.edu.au" target="_blank">
```

```
</a>
```

```
</body>
```

Link

```
<a href="http://www.uow.edu.au" target="_blank">Visit UOW</a>
```

The **href** in this example is an **absolute** URL.

If user clicks on this link, `http://www.uow.edu.au` will be opened in a new tab

target	description
<code>_blank</code>	open the link in a new window or tab
<code>_self</code>	open the link in the same frame (this is default)

Link

```
<a href="contact.html">Contact us</a>
```

The **href** in this example is a **relative** URL.

It is similar to the `src` attribute of the `img` tag:

```
href="contact.html"
```

```
href="assignment/a1.html"
```

```
href="../handout/note5.html"
```

Link

```
<a href="http://www.uow.edu.au" target="_blank">
```

```
</a>
```

Within the link tag `<a href...> `, we can put any text or image.

In the above example, it displays an image as a link to the address

`http://www.uow.edu.au`

Link - target within document

Within the html document we can use the attribute **id** to mark a specific location

```
<a href="#Proofs">1 Proofs</a>  
<a href="#See_also">2 See also</a>  
<a href="#Notes">3 Notes</a>  
<a href="#References">4 References</a>  
<a href="#External_links">5 External links</a>
```

```
<h3 id="Proofs">Proofs</h3>
```

...

```
<h3 id="See_also">See also</h3>
```

...

```
<h3 id="Notes">Notes</h3>
```

...

```
<h3 id="References">References</h3>
```

...

```
<h3 id="External_links">External links</h3>
```

...

Euler's theorem

Contents

- 1 Proofs
- 2 See also
- 3 Notes
- 4 References
- 5 External links

Proofs

• • • •

See also

• • • •

Notes

• • • •

References

• • • •

External links

• • • •

Link - target within document

Within the html document we can use the attribute **id** to mark a specific location

```
<a href="#Proofs">1 Proofs</a>
<a href="#See_also">2 See also</a>
<a href="#Notes">3 Notes</a>
<a href="#References">4 References</a>
<a href="#External_links">5 External links</a>
```

```
<h3 id="Proofs">Proofs</h3>
```

...

The id value must be unique and must contain at least one character.
The id value must not contain any space characters.

Link - target within document

We can create a link to a specific location within a html page

For example:

```
<a href="https://en.wikipedia.org/wiki/Euler%27s_theorem#Proofs">  
Proof of the Euler theorem</a>
```

Unordered List

My timetable:

``

`MATH222: Mon 8:30-10:30 lecture`

`CSCI204: Tue 9:30-11:30 lab`

`ISIT206: Wed 8:30-10:30 lecture`

``

My timetable:

MATH222: Mon 8:30-10:30 lecture

CSCI204: Tue 9:30-11:30 lab

ISIT206: Wed 8:30-10:30 lecture

Ordered List

  </tr>
</table>
```

STUDENT DETAILS	
STUDENT NAME	John Lee
STUDENT NUMBER	1234567
UOW EMAIL	jlee@uowmail.edu.au

index.html

- is a default page for a directory

In this example, I have a file **index.html** in the directory **html2**

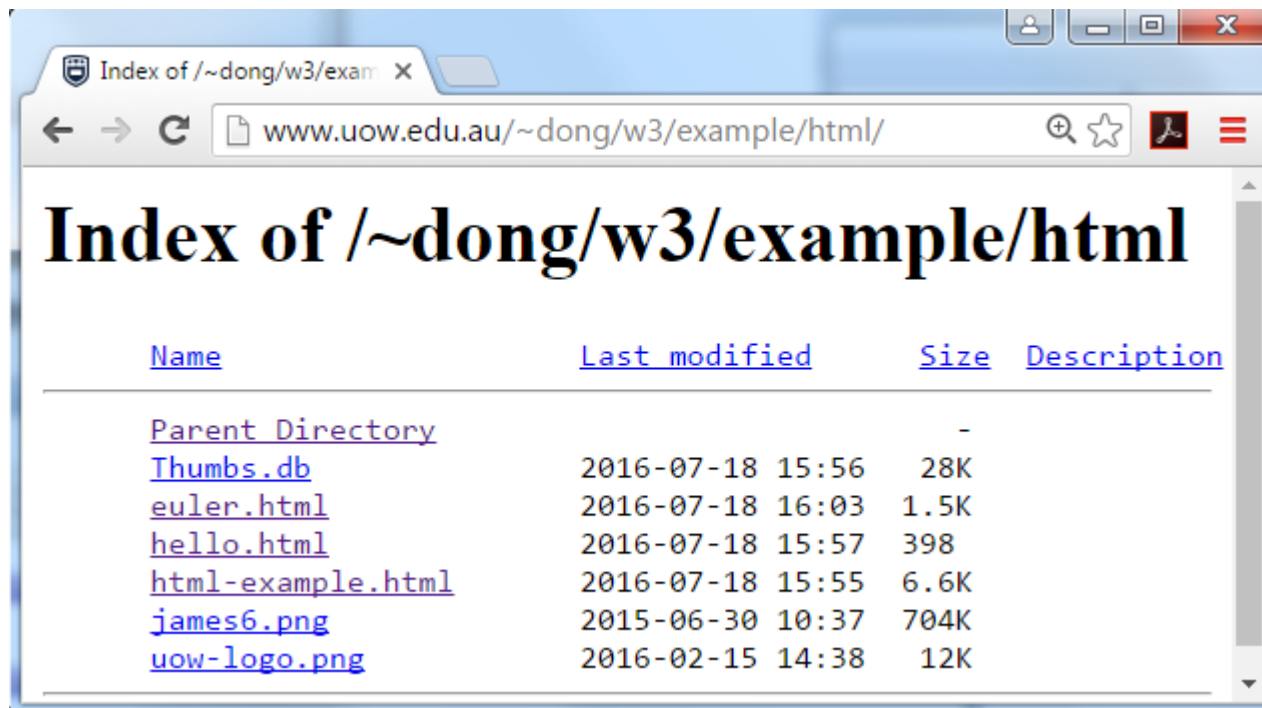

When we go to `http://www.uow.edu.au/~dong/w3/example/html2`

it automatically display the page

`http://www.uow.edu.au/~dong/w3/example/html2/index.html`

index.html

- For security reason, it is better to have index.html for every directory
- It stops people from knowing the content and structure of your website

I don't have index.html for the directory html, that is why everybody can see the content of my directory

<http://www.uow.edu.au/~dong/w3/example/html>

<https://www.lifewire.com/index-html-page-3466505>

- Using a Default File Name Like index.html is a Security Feature as Well
- Most **web servers** start out with the **directory structure visible** when someone comes to a directory without a default file. This shows them information about the website that would otherwise be hidden, such as directories and other files in that folder. This can be helpful during a site's development, but once a site is live, allowing for directory viewing can be a **security vulnerability** that you will want to avoid.
- If you don't put in an index.html file in a directory, by default most **web servers will display a file listing of all the files in that directory**. While this can be disabled at the server level, it means that you need to involve the server admin in order to make it work. If you are pressed for time and want to control this on your own, an easy workaround is to **simply write a default web page and name it index.html**. Uploading that file to your directory will help close that potential security hole. Additionally, it is also a good idea to also contact your hosting provider and ask for directory viewing to be disabled.

Comments

```
<body>
```

```
<!-- this is
```

```
a long comment
```

```
it will not be displayed on the web page
```

```
-->
```

```
</body>
```
